Dear author,
 We are happy to announce that this abstract has been accepted for presentation at the 2026 WSTLUR conference. Please find below the comments received.
 Best wishes,
 The 2026 WSTLUR committee

SUBMISSION: 133
 TITLE: Validating OpenStreetMap for detecting cycling-infrastructure change: A Barcelona pilot using Google Street View (2015–2023)

----- REVIEW 1 -----

SUBMISSION: 133
 TITLE: Validating OpenStreetMap for detecting cycling-infrastructure change: A Barcelona pilot using Google Street View (2015–2023)

----- Overall evaluation -----

SCORE: 1 (weak accept)

----- TEXT:

This paper examines the usability of OpenStreetMap (OSM) longitudinal data for cycling infrastructure. Longitudinal data are important for many studies of cycling behavior and municipal policy, but even cross-sectional data on bicycle lanes and similar infrastructure can be unreliable, let alone longitudinal data. Thus, **the paper addresses an important need.** The analysis is thorough, using Google Street View to identify whether each change in OSM is a true positive.

The limitations are primarily that **the analysis is only for Barcelona**, and it's **not clear whether the conclusions generalize to other cities.** I also think the **authors need a larger sample to detect False Negatives.** Finally, it's a very narrow paper about the usability a specific dataset, and could probably be presented in less than 5 minutes. However, it could be of interest to some WSTLUR attendees.

----- TEXT:

This is an interesting research examining changes in cycling infrastructure within OSM through street view images. It includes solid analysis and interesting findings. I expect that further analysis could link the changes in cycling infrastructure to transportation planning, offering policy implications. Additionally, semantic segmentation methods in computer vision have the potential to efficiently identify cycling infrastructure across cities, facilitating effective verification.
